Introduction to ML strategy

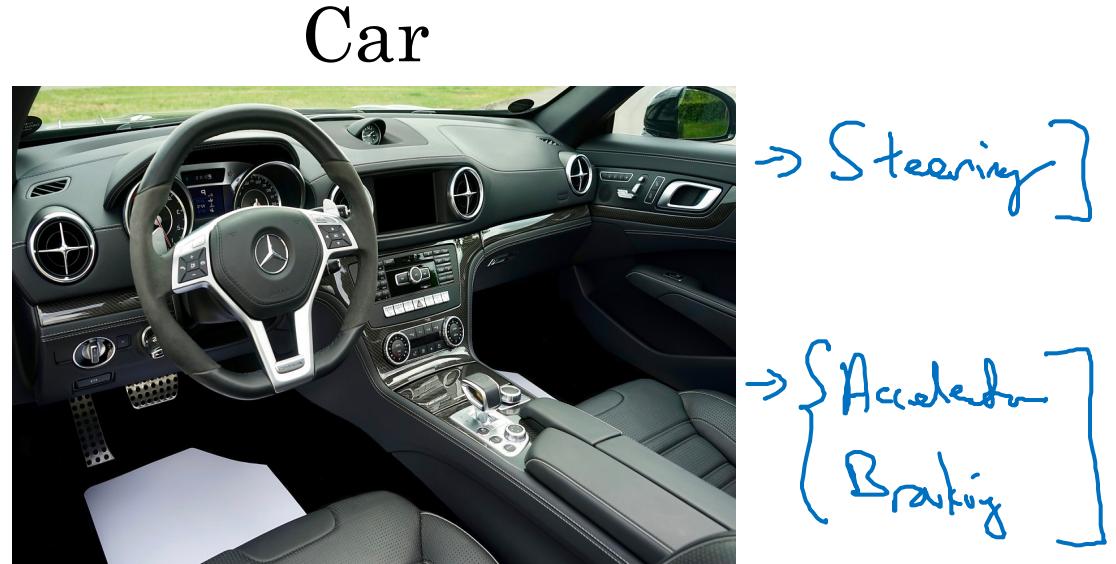

Orthogonalization

TV tuning example

Orthogonalization

$$\begin{aligned}
 & 0.1 \times \begin{array}{c} \uparrow \\ \downarrow \end{array} \\
 + & 0.3 \times \begin{array}{c} \leftarrow \\ \rightarrow \end{array} \\
 - & 1.7 \times \begin{array}{c} \diagdown \\ \diagup \end{array} \\
 + & 0.8 \times \begin{array}{c} \leftarrow \\ \rightarrow \end{array} \\
 + \dots & \begin{array}{c} \diagdown \\ \diagup \end{array}
 \end{aligned}$$

$$\begin{aligned}
 & \rightarrow \underline{0.3 \times \text{angle}} - 0.8 \text{ speed} \\
 & \rightarrow 2 \times \text{angle} + 0.9 \text{ speed} .
 \end{aligned}$$

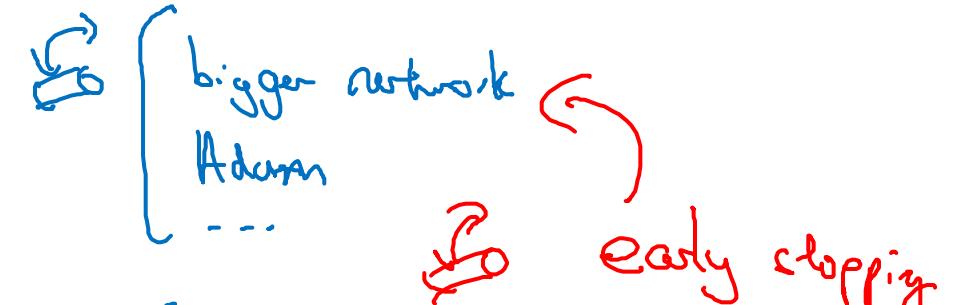

Speed angle

Chain of assumptions in ML

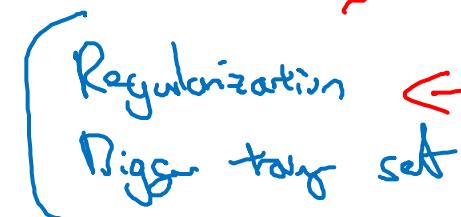

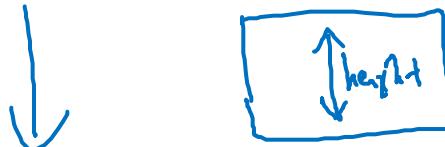

→ Fit training set well on cost function

(\approx human-level performance)

→ Fit dev set well on cost function

→ Fit test set well on cost function

Bigger dev set

→ Performs well in real world

(Happy cat pic off users.)

Change dev set or
cost function
